

## 1 2.1 - Sets

Sets are groups of objects, often Numbers. Objects in sets usually have something in common, as otherwise a set would be nonsensical.

### 1.1 Common Sets

1. The set of all Complex numbers -  $\mathbb{C}$  ( $\backslash\mathrm{mathbb{C}}$ )
2. The set of all Real numbers -  $\mathbb{R}$  ( $\backslash\mathrm{mathbb{R}}$ )
3. The set of all Rational numbers -  $\mathbb{Q}$  ( $\backslash\mathrm{mathbb{Q}}$ )
4. The set of all Integer numbers -  $\mathbb{Z}$  ( $\backslash\mathrm{mathbb{Z}}$ )
5. The set of all Natural numbers -  $\mathbb{N}$  ( $\backslash\mathrm{mathbb{N}}$ )
6. The set of all Imaginary numbers -  $\mathbb{I}$  ( $\backslash\mathrm{mathbb{I}}$ )
7. The empty Set -  $\emptyset$  or  $\{\}$  ( $\backslash\mathrm{emptyset}$  or  $\backslash\{\}$ )

$$\mathbb{N} \in \mathbb{Z} \in \mathbb{Q} \in \mathbb{R} \in \mathbb{C}$$

$$\mathbb{I} \in \mathbb{C}$$

### 1.2 Subsets

The set  $A$  is a *subset* of  $B$  iff  $B$  contains **all** objects of  $A$ .  $A$  being a subset of  $B$  can also be expressed as  $B$  is a *superset* of  $A$ . Subsets are written as  $\in$  ( $\backslash\mathrm{in}$ ) in equations.

### 1.3 Size of a Set

$|S|$  denotes the size, or number of *distinct*<sup>1</sup> objects in set  $S$ . Size is also called the *Cardinality* of a **finite** set.

### 1.4 Power Sets

A Power Set is one that includes all subsets of another set. Power Sets are denoted by  $\mathcal{P}(S)$  ( $\backslash\mathrm{mathcal{P}}\{P\}(S)$ ) in equations.

### 1.5 Ordered n-tuple

An ordered n-tuple is an ordered collection denoted by  $(a_1, a_2, \dots)$  ( $(a_1, a_2, \dots)$ ) Ordered tuples are equal if they have the same elements at the same locations.

---

<sup>1</sup>Distinct objects means that equivalent objects are only counted once, e.g.  $|2, 2| = 1$  as 2 is only counted once
